Met Éireann Archive

The archive holds

- Catalogued handwritten records back to 1834 (Phoenix Park)
- Copies of diaries held by other archives dating back to 1734
- In 2019 approximately 150 previously undocumented manuscripts were found at a number of locations
- Further data has been found in recent years;
  - Army medical records
  - Agricultural statistics of the weather

Every observer is requested to fill in this section and also the space for notes as far as possible:—

Name and Address to which any inquiry relating to this register should be sent:—

J. Jordan
Boyle Co. Roscommon

Hour of observation by the clock—in Winter 9 a.m. in Summer 9 a.m.

Nearest Railway Station Boyle Distance ½ mile Direction from gauge N.E.

Nearest Parish Church at Boyle Distance 200 yds. Direction from gauge S.

Nature of objects nearest to gauge	Tree	about 50 ft		
Heights of objects	50 ft			
Distances ..	100 yds.			
Directions from gauge ..	N.W.			

If gauge has been moved during the year state—

Date of move — Distance — Direction —

Indicate pattern of gauge in use by deleting those sketches of cross sections of gauges which do not represent it. If the pattern is different from any of these please make a sketch of it. (Good gauges to use are those marked **A** and **B**.)

If the gauge is of a self-registering or self-recording type please give particulars.

If you know of any record of rainfall not quoted in **British Rainfall,** please give the observer's name and address:—

NOTES ON EXCEPTIONAL RAINFALL OF THE YEAR.

In giving particulars of falls of unusual intensity it is desirable that answers to the following questions be supplied:—

(a) Is it known that the gauge was empty at the beginning of the measured rainfall?
(b) What note was made of the times of beginning and end of this fall?
(c) When was the measurement made?

D INSTRUCTIONS.

1. Rules for measuring the rainfall and for correctly recording the measurements are given in "Rules for Rainfall Observers," to be obtained gratis from The Director, Meteorological Office, Air Ministry, London, W.C.2, or from The Superintendent, Meteorological Office, 6, Drumsheugh Gardens, Edinburgh.

2. In filling up the register on the reverse side the following rules should be observed. Those rules which apply also to the summary form above are printed in *italic type*:—

(a) *Rain should be measured each morning, preferably at 9 a.m., Greenwich Mean Time. The measurement is to be credited to the previous day and should be entered in the register at the time of observation. Thus the entry for January 1st is the rainfall for the 24 hours following 9 a.m. on January 1st; it is therefore the amount measured on January 2nd. 9 a.m. Greenwich Mean Time is 10 a.m. by the clock during Summer Time Period.*

(b) *The raingauge should be visited every morning without exception.* When there has been no precipitation the entry in the register should be a dash— (not '00). The entry "trace" or "tr" is to be made in the two following cases, (A) and (B).

(A) When there is less than ·005 in. of water in the gauge and the observer knows that this is not the result of a drop or two draining from the sides of the can after emptying the rainwater out of it at a previous time of observation, i.e., the observer must be reasonably certain that there has actually been precipitation since the preceding measurement. If the observer knows that the precipitation has been in the form of dew or wet fog this may be noted.

(B) The observer knows definitely from his own observation that some rain (or other form of precipitation such as snow, hail, sleet or drizzle) has fallen since the preceding observation, and yet finds no water in the gauge. This happens sometimes especially in dry, warm weather, without the gauge being even damp, the small amount of rain having evaporated before it got into the receiving can.

(c) *On some measures there is graduation marked ·005; this graduation is to show the limit between the amounts which count as ·01 and those which are mere "traces."* An entry ·005 is not to be made in the register.

(d) If the morning observation has to be omitted for one day or more, the days covered by the next reading should be indicated by a bracket. Thus $\left.\begin{matrix}17\\18\end{matrix}\right\}$ ·14 would show that the reading on the morning of the 18th day of the month was ·14 in.

(e) *The total rainfall for the month is found by addition. The addition should always be done a second time as a check.* The check is of special importance when the total has already been found in another copy of the register.

(f) *The "number of days with ·01 in. or more" includes all the days with any rain except those for which the entry is "trace." The "number of days with ·04 in. or more" includes all the days with any rain except those for which the entries are trace, ·01, ·02, or ·03.*

(g) If observations are not available for every day during the month the spaces for the number of days with rain should be left blank.

(h) The heaviest daily fall for each month should be underlined.

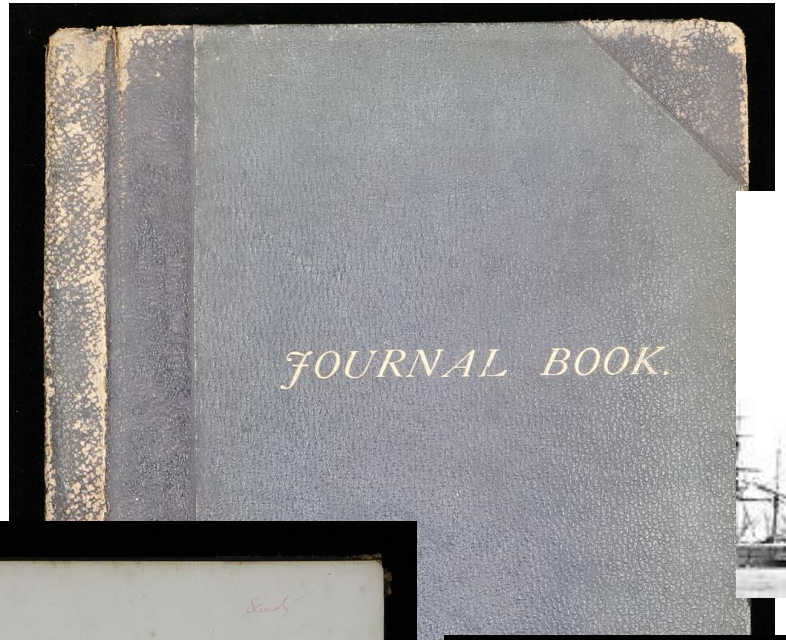
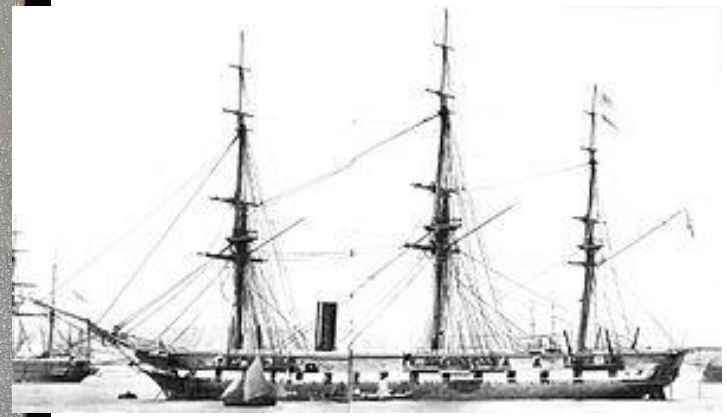
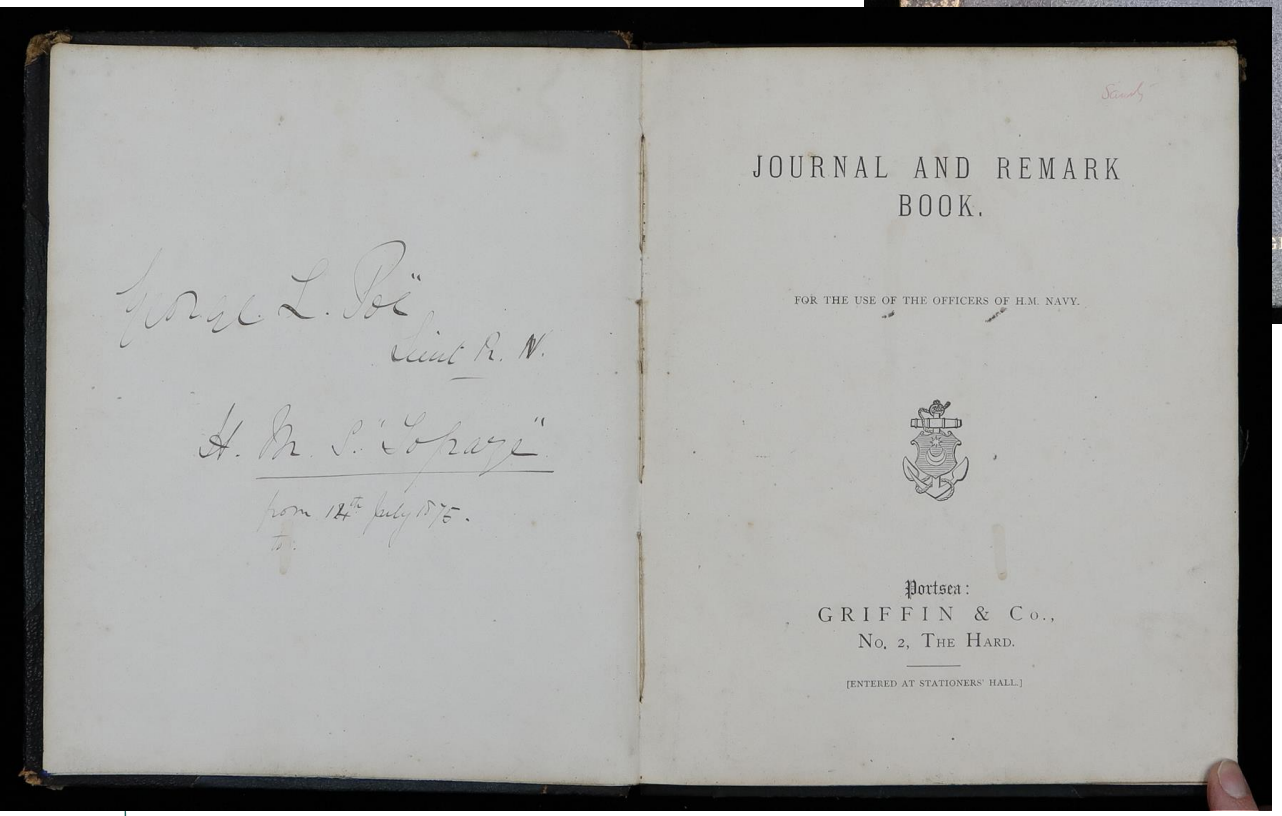
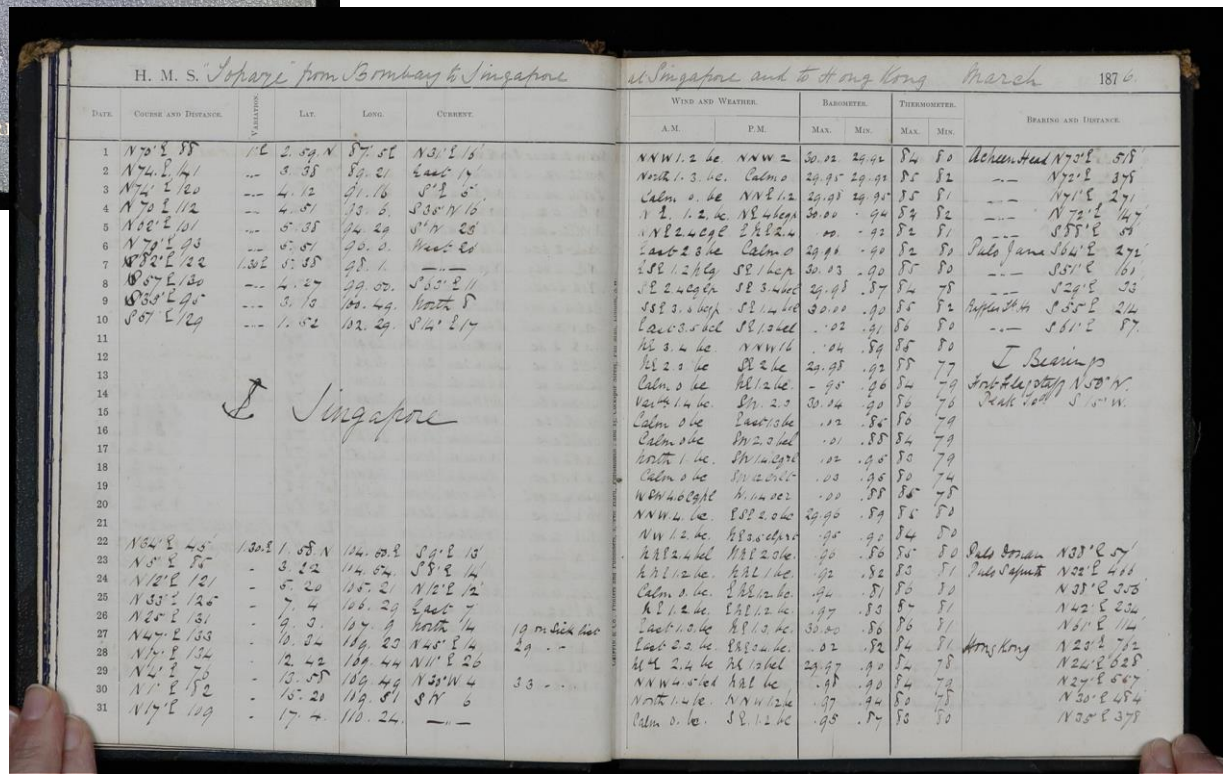
H.M.S. Topaze log

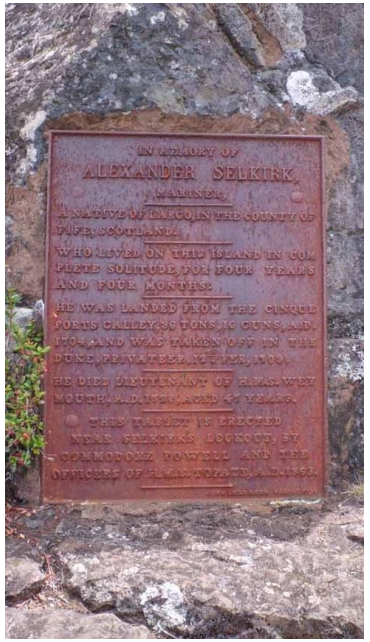
Launched 12 May 1858, Devonport
Commissioned 11 June 1859
Decommissioned 28 June 1878
Fate Sold on 14 February 1884 and broken up at Charlton











HMS Topaze was a 51-gun Liffey-class wooden screw frigate of the Royal Navy.

Her crew assisted in the building of the Race Rocks Lighthouse in British Columbia, Canada, and laid a bronze tablet in 1868 at the Juan Fernández Islands commemorating the stay of marooned sailor Alexander Selkirk.

The voyage to Easter Island in 1868 saw the crew remove the two moai Hoa Hakananai'a and Moai Hava and ship them to Britain.[3] Hoa Hakananai'a was found in November 1868 by officers and crew from the Topaze. When first seen, it was buried up to about half its height or even more. It was dug out, dragged down on a sledge, and rafted out to the ship. The Admiralty offered the moai to Queen Victoria, who proposed that they should be given to the British Museum.

VALENTIA OBSERVATORY.

Prior to 1867, the Meteorological Office received daily weather reports from a number of stations in the British Isles. Among these stations was Foilhummerun on Valentia Island which was maintained by the Magnetic Telegraph Company.

In 1867, the Meteorological Office decided to establish an Observatory at Valentia and steps were taken to provide suitable premises. An agreement was signed on 14th November, 1867, for the renting of Revenue House, Valentia Island, by the Director of the Meteorological Office (for the Meteorological Committee of the Royal Society) from Peter Fitzgerald, Esq., Knight of Kerry, on a lease of 21 years at an annual rental of £50.

In 1890, it became necessary to obtain larger premises for the Observatory and accommodation was found to be Westwood House, a mile and a half from Cahirciveen. This house was held under a direct lease from Trinity College, Dublin, and the lease then had 80 years to run. Negotiations were commenced and as the Meteorological Council and their dependence on Parliamentary grant made it impossible for them to enter into an agreement such as was involved in the purchase of a lease for a long term of years, it was agreed that the purchase should be in the name of the Royal Society the purchase money and ground rent, together with all other liabilities being at the charge of the Meteorological Office. The Treasury approved of the purchase of the lease of Westwood House for the sum of £1,300 and a cheque for that amount was drawn in favour of the Treasurer of the Royal Society, in February, 1892.

In 1905 a Meteorological Committee appointed by H.M. Treasury took over from the Meteorological Council of the Royal Society the administration of the Parliamentary grant and the general control of the Meteorological Office, and it was proposed that the property held by the Meteorological Council should be vested in one of the Permanent Secretaries of the Treasury and the Director of the Meteorological Office. In 1907 the beneficial interest in the lease of Westwood House, Cahirciveen (Valentia) was assigned to Sir G. Murray and Dr. W.N. Shaw (Director of the Meteorological Office).

On 1st October, 1919, the Air Ministry took over the control and administration of the Meteorological Office.

Rescuing Ireland's Climate and Rainfall Data

Data Rescue initiatives:

1. Rainfall Data Rescue involving 3rd level students in Maynooth University "Integrating Data Rescue into the classroom"
2. Maximum and Minimum Temperature Data Rescue at Galway University (NUIG)
3. Full climate journals with the Central Statistics Office
4. Other data rescue projects

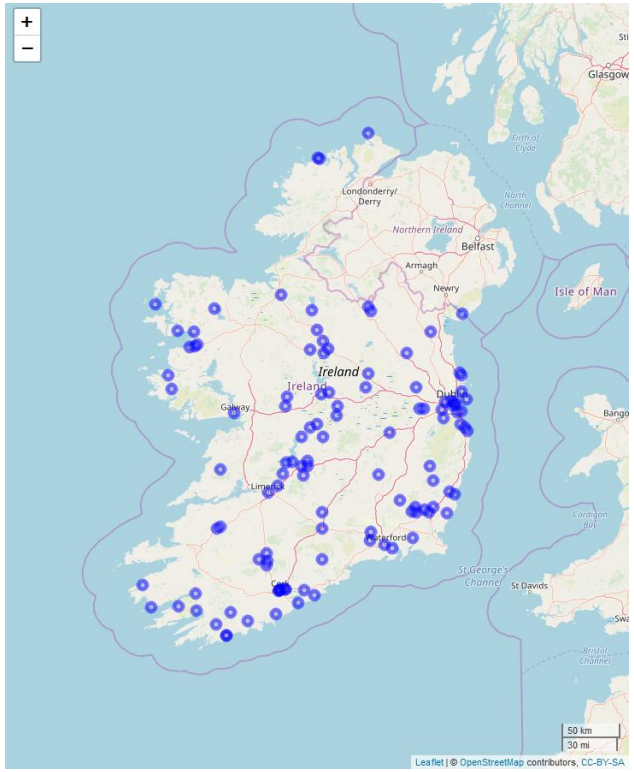
Data Rescue: Integrating Data Rescue into the Classroom

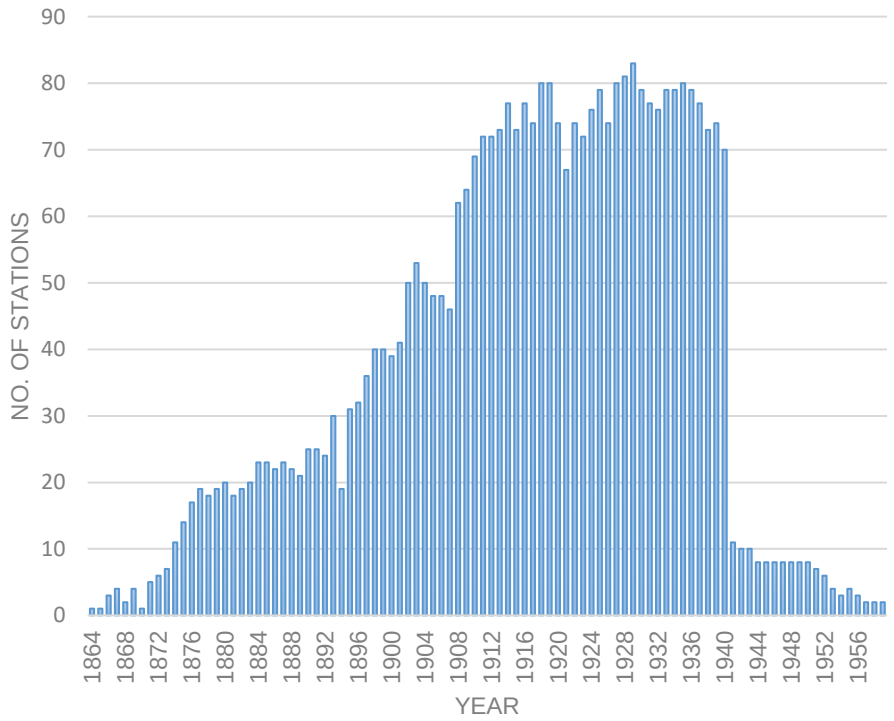
Collaboration between Met Éireann and Maynooth University, Ciara Ryan Ph.D. student (now a meteorologist in Met Éireann.

An award winning project to rescue daily rainfall data.

Data Rescue: Integrating Data Rescue into the Classroom

3,616 station years of rainfall data (1.32 million daily values) transcribed from 1864 to 1856





Rainfall has been rescued from 114 sites

An Roinn Tithíochta, Pleanála agus Rialtais Áitiúil
Department of Housing, Planning and Local Government

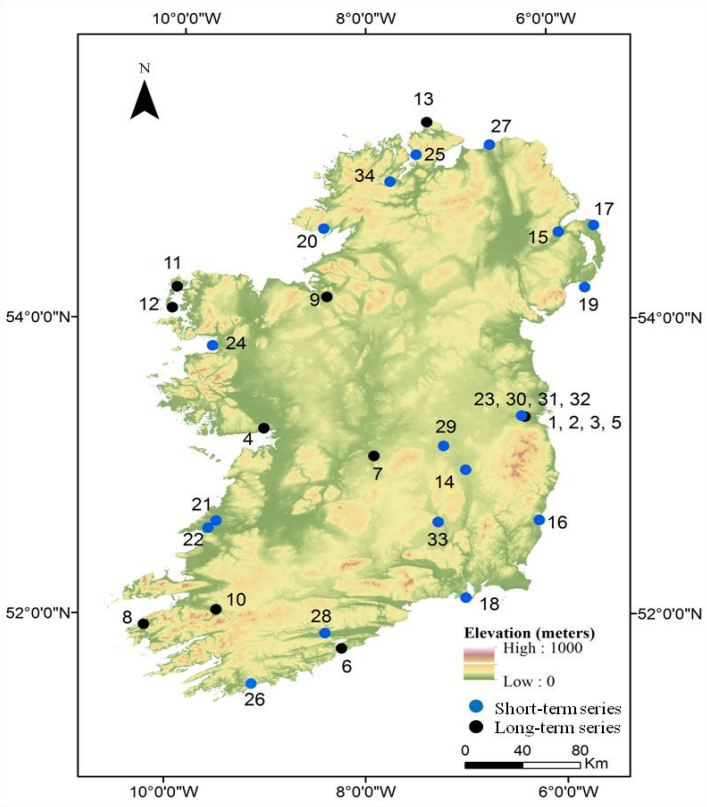
Rescuing Long-term Maximum and Minimum Air Temperature Series

12 long and 21 short term series were rescued from 1831 to 1968.
97,000 daily maximum and minimum values transcribed for



Carla Mateus

The data was rescued from multiple sources, ~76% was rescued from the Met Éireann archive.

Rescuing Full Weather Journals

Partnership with Central Statistics Office

Finally……

None of this work would be possible without

- the assistance of staff and students at various organisations and volunteers who transcribed the records (Patricia McGrath and Aoife O'Mullane)

- the observers who meticulously recorded the weather over the years.
